# IIDD 2 FINAL COURSE PROJECT

Documentation Report

| | |
|---|---|
| **Course Code & Title** | IIDD 2 – [Course Title] |
| **Project Name** | Individual Web Portfolio for Industry & OJT Placement |
| **Student Full Name** | Fernando Ezekiel P. Vergara |
| **Student ID** | 2023103662 |
| **Program & Section** | Bachelor of Industrial Technology, Major in Computer Technology – [Section] |
| **Instructor** | Ma’am Vinna Niña O. Ramos |
| **Active Deployment URL** | https://baconws10life.github.io/ojt-portfolio/ [confirm after deployment] |
| **Date of Submission** | [Date of Submission] |

# Section 1: Developer Profile & Links

**Target Industry Track / Role:** UI/UX, Web Development & Video Editing Intern

**Live Deployment URL:** https://baconws10life.github.io/ojt-portfolio/ [confirm after deployment]

**Public GitHub Repository Link:** https://github.com/baconws10life/ojt-portfolio [confirm after creating the repository]

## Professional Elevator Pitch

I am a Computer Technology student at Bulacan State University's College of Industrial Technology with hands-on experience in UI/UX design in Figma, front-end web development, and video editing. I contributed to SoilSense, a TinyML-based soil analysis system with a Flask web dashboard, and I lead marketing and multimedia work for the Society of Proficient and Innovative Computer Enthusiasts (SPICE). I am ready to bring clean, user-centered interface and multimedia work to a partner company during my 600-hour OJT.

## Cover Letter

[Date]

[Hiring Manager / Company Name and Address]

Dear Hiring Manager,

I am Fernando Ezekiel P. Vergara, a Computer Technology student at Bulacan State University – College of Industrial Technology, expected to graduate in 2027. I am applying for your On-the-Job Training program as a UI/UX, Web Development & Video Editing Intern, and I am available starting the 2nd Semester of A.Y. 2026–2027 to render the required 600 training hours.

My experience covers interface design and prototyping in Figma, front-end development with HTML, CSS, and basic JavaScript, and multimedia production with Adobe Photoshop, Premiere Pro, and After Effects. For our thesis, SoilSense, our team built a low-cost TinyML soil analysis system with a Flask and PostgreSQL web dashboard for Fortunato F. Halili National Agricultural School. As Director for Marketing & Multimedia of SPICE, I develop promotional materials and event branding, and I served as an organizer for the Bulacan Tech Expo.

I would welcome the opportunity to bring my creativity, attention to detail, and willingness to learn to your team. My portfolio is available at https://baconws10life.github.io/ojt-portfolio/, and I can be reached at

verkiel7@gmail.com or 0936-135-3762. Thank you for your time and consideration.

Respectfully,
Fernando Ezekiel P. Vergara

# Section 2: Technology Stack & AI Tooling

## 1. Coding Environment & Core Stack

The portfolio is written in semantic HTML5, modern CSS3 (Flexbox, CSS Grid, custom properties, media queries), and a small amount of vanilla JavaScript for the hero carousel, skill cards, project gallery, sticky navigation, and scroll-to-top button. Illustrations are inline and standalone SVG. No external CSS frameworks were used. Code editor: [confirm, e.g., VS Code]. Browser inspection: [confirm, e.g., Chrome DevTools device mode].

## 2. AI & Vibe Coding Tools Used

I used Claude (Claude Sonnet 5.5) through the Claude chat interface. I chose it because it accepts reference images and PDF files, so I could give it my CV, the project brief, my thesis document, and a design reference in one conversation. It also produces a live preview that I could review and correct through follow-up prompts. I also used Google Gemini's image generator to create photo-style images of me doing each skill from my reference photo, because Claude's chat cannot generate photographic images.

## 3. Deployment Platform

GitHub Pages [confirm your final choice]. It is free, is the platform recommended in the project brief, and publishes directly from the public repository, which keeps the source code and the live site linked in one place.

# Section 3: Prompt Engineering Strategies & Iteration Log

## 1. Prompting Strategies Applied

**Context-setting.** I supplied the AI with the information it needed upfront: a reference design image for the visual theme, my CV, the course project brief, and my thesis PDF. I also stated exact details such as the 600-hour requirement, the availability window (2nd Semester A.Y. 2026–2027), my GitHub and LinkedIn username, and my preferred deployment location (Bulacan or Metro Manila). This kept the content accurate and tied to my real background.

**Iterative, component-by-component prompting.** After each preview I asked for changes to one component at a time, such as the profile photo size, the hero image

carousel, the sticky navigation bar, and the detail panel of each skill card. Narrow requests let me fix one problem without breaking the rest of the page.

## 2. Prompt Iteration Log (Before and After)

**Instance A (Layout / Component Issue)**

**Initial Prompt Given:**

> *"make the design professional, but easy to understand, making it have theme and design like the image i sent you, on other missing information just say it and ill give it to you for now just have a placeholder, dont use emojis just profesional looking icons, give me a preivew of the website through here" (quoted as written)*

**Flaw in AI Output:** The first version copied the reference layout too literally. A very large black-and-white portrait of my face filled half of the hero section, and the oversized name was placed over the photo and nearby text, so the section looked crowded and the name overlapped other content.

**Corrective Follow-Up Prompt / Strategy Used:**

> *"dont put my face in that big picture put images based on the skill set i have just put placeholders or images you can find or generated images have it carousel it looks wierd with my face that is too big and have the face smaller like a profile … also my name is hovering over some texts" (quoted as written)*

**Result:** The large portrait was replaced with a skills carousel, the face became a small circular profile photo, and the name was moved into normal page flow beside it. A floating scroll-to-top button was also added.

**Instance B (Styling / Behavioral Issue)**

**Initial Prompt Given:** The corrective prompt from Instance A, which asked for a skills-based image carousel and a smaller profile photo.

**Flaw in AI Output:** The availability and location text was placed on top of the carousel illustrations, so it was blocked and hard to read. The carousel illustrations were also generic and did not show me doing the skills. The page had no navigation once the visitor scrolled past the hero.

**Corrective Follow-Up Prompt / Strategy Used:**

> *"Availability … Location … this is being blocked in the images i cant see it … have a nav bar when scrolling down instead so they can see where theyre going and they could just click on it … have the software icons on the detailed skills and have generated images of me doing the skill in the detailed skills" (quoted as written)*

**Result:** Availability and location moved into their own bar below the carousel. The generic illustrations were first replaced with drawn scenes and later with AI-generated photos of me doing each skill, created in Google Gemini from my reference photo. A sticky navigation bar with active-section highlighting was added, and the skill cards now show software icon badges. Claude cannot generate photographic images, so I generated those in Gemini and added them to the project folders myself.

# Section 4: Real Bottlenecks & Practical Problem-Solving

## Bottleneck 1: Layout & Mobile View Quirks

The oversized hero name and portrait crowded the layout, and on narrow screens the name was positioned relative to the whole hero section instead of the photo, which risked overlapping the content below. I fixed it by moving the name into the normal flow of the profile panel next to a small avatar, stacking the hero into one column below 760 px, and giving the carousel a fixed height on mobile. [Add what you personally saw when testing on your phone or in DevTools device mode].

## Bottleneck 2: Live Deployment / Asset Loading Issues

[Complete after deploying: describe any image, stylesheet, or link that failed to load online, the cause (for example path casing or directory errors), and how you resolved it. All paths in this project are relative, such as assets/css/style.css and assets/img/profile.jpg].

## Bottleneck 3: Working with AI-Generated Code

The AI first produced one large HTML file with the CSS, JavaScript, and images embedded. The project brief requires a specific folder structure, so the code had to be separated into index.html, assets/css/style.css, assets/js/main.js, and image files, with every path converted to a relative path. Another challenge was that Claude cannot generate photographic images, so I generated the skill photos in Google Gemini and placed them in the project folders myself. Keeping one consistent color palette, spacing, and hover behavior across all sections also required several rounds of review.

# Section 5: Experience Reflection & OJT Readiness

## 1. Human vs. AI Roles

The AI was best at scaffolding the semantic structure, writing responsive CSS, building small interactive features, and turning my CV, project brief, and thesis into organized page content quickly. It could not judge on its own what looked wrong to a real viewer, such as a photo that was too large or text that was blocked, and it could not provide real

photos, final links, or deployment results. I had to review each preview, point out the problems, supply accurate personal information, and verify the final result.

## 2. OJT Industry Readiness

The Featured Projects section best shows that I am ready. It leads with our thesis, SoilSense, a working web system for a real school, and the Technical Skills section explains what I do with each tool and which applications I use. Together with the Contact section and the downloadable CV, a recruiter can see both my skills and my evidence in one visit.

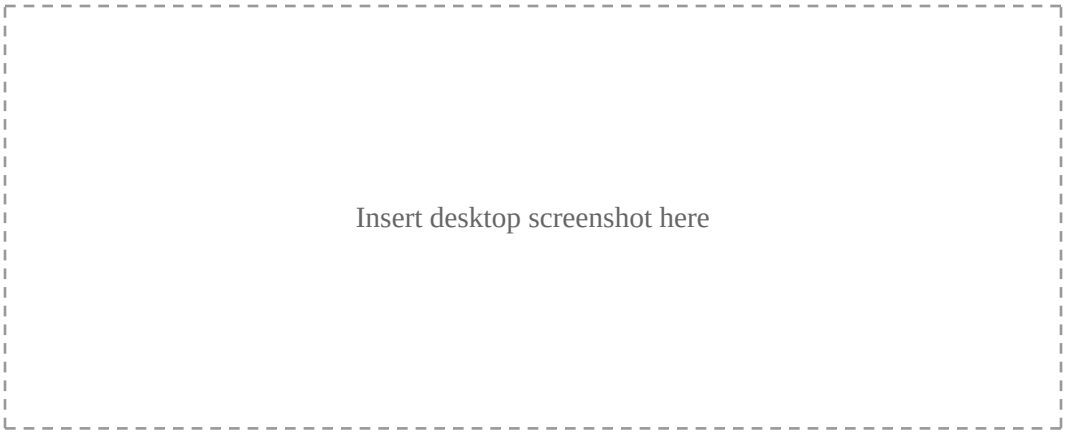

## 3. Future Upgrades

Before sending the portfolio to companies, I plan to add photos for my video editing and robotics skills, replace the LAFVIN manufacturer photos with photos of my own build, and confirm that every external link works. [Edit this to the one upgrade you actually plan].

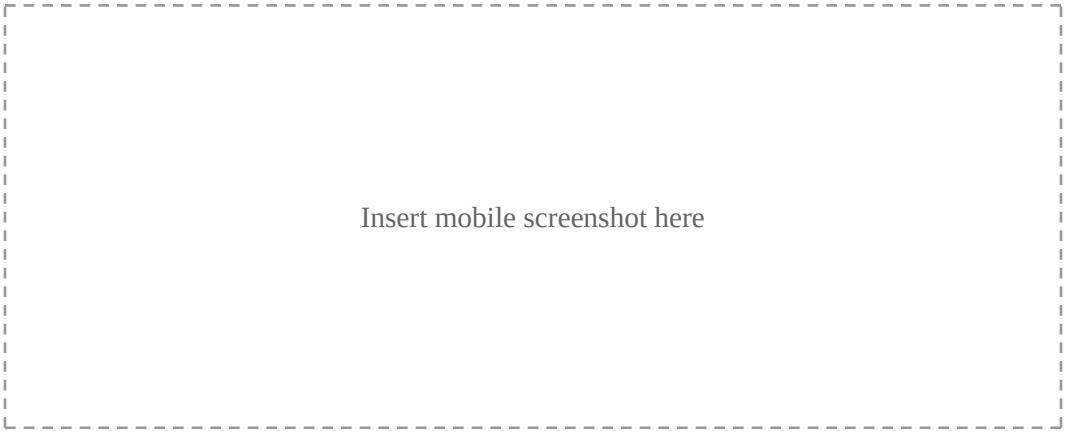

## Section 6: Proof of Deployment & Screenshots

Insert clean, uncropped screenshots with the browser URL address bar visible.

**Full-page desktop view of the live deployed website**

**Full-page mobile view of the live deployed website**

**Active public GitHub repository**
